

Mathematical Models and Methods for Image Processing

Spring 2022

What is this course about?

What is this course about?

*It is about **algorithms** for processing **images** and solving image-related problems.*

What is this course about?

*It is about **algorithms** for processing **images** and solving image-related problems.*

..like denoising

Who cares about images?

Who cares about images?

Everybody!

We will see algorithms solving problems customarily addressed in our phones,

$$z = y + \eta, \quad \eta \sim \mathcal{N}(0, \sigma^2)$$

$$\hat{y} \approx y$$

Denoising is a regression problem: given the noisy z , estimate \hat{y} close to the unknown y

Who cares about images? Quality Inspection

Who cares about images? Quality Inspection

Here regression is also crucial

$$\mathbf{z} = \mathcal{R}(\mathbf{y}) + \boldsymbol{\eta}$$

Who cares about images? Quality Inspection

Carrera D., Manganini F., Boracchi G., Lanzarone E. *"Defect Detection in SEM Images of Nanofibrous Materials"*, IEEE Transactions on Industrial Informatics 2017, 11 pages, doi:10.1109/TII.2016.2641472

Who cares about images? Quality Inspection

This boils down to Outlier Detection!

$$\hat{\phi}_0(\hat{x}) \geq \Gamma$$

where

$$\hat{x} = \underset{x}{\operatorname{argmin}} \frac{1}{2} \|Dx - z\|_2^2 + \lambda \|x\|_1$$

Who cares about images? *visual recognition systems*

This is a (robust) fitting problem

$$\hat{\theta} = \operatorname{argmin}_{\theta} \sum_{x_i} \rho(\operatorname{dist}(x_i, \mathcal{M}_{\theta}))$$

Who cares about images? *visual recognition systems*

(a) Input point cloud

(b) Recovered structures

This is a (robust) fitting problem

This is a (robust) fitting problem

Is this interesting for a (perspective) Mathematical Engineer?

Is this interesting? Sure!

All the algorithms build upon:

- a clear problem formulation
- a simple mathematical model (...often linear combinations!)
- Sound mathematical solutions (linear algebra, least squares, convex optimization)

...and the result is not just a number... it's an image!

Ok, to recap

Mathematical Models and Methods for Image Processing (5 CFU)

The primary goal of this laboratory course is to let the students design, implement and practice algorithms based on simple mathematical models from linear algebra and convex optimization, and solve challenging inverse problems in image processing (denoising, deblurring, inpainting, anomaly detection)

Mathematical Models and Methods for Image Processing (5 CFU)

The course topics include:

- **Image models based on orthonormal bases** (Fourier, wavelets), **data-driven basis** (PCA, Gram-Schmidt) and **local polynomial approximation**.
- **Sparsity and redundancy**.
 - Away from Orthonormal Basis, redundant set of generators
 - Sparse coding with ℓ^0 (OMP) or ℓ^1 norm (convex optimization ISTA, IRLS, LASSO)
 - Dictionaries yielding sparse representations and dictionary learning (KSVD)
- **Applications of sparse models** to image denoising, inpainting, anomaly detection and classification.
- **Robust fitting** methods (RANSAC, LMEDS, HOUGH) and their sequential counterparts for object detection in images.

Course Organization

Lectures: 20 hours

Laboratory: 30 hours

There will be short theory recap and then you will be invited to develop and practice presented algorithms. Some demo code to fill in will be provided.

Simple assignment provided during lectures, oral exam.

Frequently Asked Questions

Q: Any specific background?

A: linear algebra, statistics and calculus

Q: Any programming skill required?

A: Proficiency in Matlab or Python

Q: Plenty of neural networks then?

A: No way. No neural networks allowed here 😊*

Only expert-driven algorithms designed upon a clear mathematical modeling that admits closed-form solutions / sound optimization schemes.

Questions?

Denoising over adaptively defined neighborhoods
for local polynomial regression
